Sequence 18, Application US/09134607A
Patent No. 6252141
GENERAL INFORMATION:
APPLICANT: Joseph Hirschberg et al.
TITLE OF INVENTION: POLYNUCLEGOTIBES CONTROLLING THE EXPRESSION
TITLE OF INVENTION: OF SAME FOR ALTERING CAROTENOID
TITLE OF INVENTION: BIOSYNTHESIS
NUMBER OF SEQUENCES: 25
CORRESPENDENCE ALDRESS:
ADDRESSER: Mark M. Friedman c/o Anthony Castorina
STREET: 20001 Jefferson Davis Highway, Suite 207
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compounds such a method is useful for producing carotenoid compounds such as antheraxanthin and astexanthin, by using microorganism having a nucleic acid molecule encoding enzymes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid blosynthetic pathway and which metabolize single carbon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Carotenoid, isopentenyl pyrophosphate, antheraxanthin, astaxanthin, d:

to produce particular carotenoids and polypeptides useful in cell

```
ö
the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii lycopene cyclase (CrtX) enzyme used in the invention
                                                                                                                                                                                                                                          180

                                              The invention comprises the amino acid and coding sequence of a number o carotenoid (crt)-related proteins. The crt-related DNA and protein sequences of the invention are useful for engineering cells which are able to produce carotenoids. The present amino acid sequence represents crt-related protein of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ð
                                                                                                                                                                             The present invention describes Pantoea stewartil carotemoid biosynthetic enzymes (I). More specifically described are the geranylgeranyl pyrophosphate synthase (crtE), zeaxanthin glucosyl transferase (crtX), lycopene cyclase (crtZ), phytoene desaturase (crtI), phytoene synthase (crtB) and beta-carotene hydroxylase (crtZ) enzymes (see ABP96685 to ABP96690) encoded by ACC44759 to ACC4764. (I) can be used for requlating carotemoid biosynthesis in an organism, by over-expressing (I) in an organism, such that the carotemoid biosynthesis is altered in the organism. (I) and the genes encoding (I) are useful for converting bytoene to the carotemoids, for creating recombinant organisms that have the ability to produce various carotemoid compounds, and also for enhancing or manipulating carotemoid compounds. (I) can also be used for producting gene products having enhanced or altered activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       슝
                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                            This invention describes a novel method for the preparation of carotenoids using genes and proteins isolated from Candida utilis. The invention specifically describes the isolation of a 3-hydroxy-3-methylglutaryl coenzyme A (HMG-COA) reductase protein. This sequence represents the Candida utilis crty protein which is used in the method of the invention. (Updated on 17-OCT-2003 to standardise OS field)

The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtE, crtE, crtI, crtY, crtZ, crtX or are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucoside are collected. The carotenoid glucosides are used as food additives.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ठ
                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes beta-carotin hydroxylase. Beta-carotene can be used in the preparation of xanthophylls and their metabolites. The present sequence represents an Erwinia uredovora crtY protein sequence from the present invention. Beta-carotene is an effective and apparently harmless food colourant and is also in the pathway for biological synthesis of further of carotemoids such as zeaxanthin and zeaxanthin diglucoside. Other enzymes involved in the carotemoid biosynthesis pathway include geranylgearnyl pyrophosphate (AAW0119), phytoene synthase (W01121) and phytoene dehydrogenase-4H (AAW01123). (Updated on 25-MAR-2003 to correct pf field.) (Updated on 16-OCT-2003 to standardise OS field)

```
molecule comprises at least 1125 bp and is present in the plasmids pARC147, pARC1509, pARC1510 and pARC1520. The present sequence represents lycopene cyclase. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yeasts or plants, with increased beta-carotene levels. Beta-carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 22-MAR-2003 to correct pf field.) (Updated on 17-0CT-2003 to standardise OS field)

```
There are a total of six relevant genes in a 7900 bp region that cause E. coli cells to produce GGPP and the carotenoids phytoene through zeaxanthin diglucoside, which is the final prod. identified in the carotenoid pathway contd. in plasmid pakC376 (contg. a ca. 13 kb chromosomal DNA fragment isolated by Perry et al., J. Bacteriol., 168:607 chromosomal DNA fragment isolated by Perry et al., J. Bacteriol., 168:607 (1986). The genes for geranylgaranyl pyrophosphate (GGPP) synthase, phytoene edbydrogenase-4H, lycopene cyclase, beta-carotene hydroxylase, and zeaxanthin glycosylase are represented in AAQ13716, AAQ13718, AAQ13722, AAQ13724 and AAQ13726 for respectively. The native sequence (AAQ13722 and AAQ13724 and AAQ13726 for the gene, the native initiation GTG codon has been changed to an ATG codon. The second anno acid residue, Asg, was originally encoded by an AGG codon that was changed to a CGG codon, while retaining its coding for the Arg amino acid residue. Recombinant expression plasmids can be used to produce large amis. of the enzymes and hence large amis. of the carotenoids which they synthesise. (Updated on 25-MAR-2003 to correct PP field.) (Updated on 24-OCT-C2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                           Biosynthesis of carotenoid(s) in genetically engineered hosts - using DNA encoding enzymes from Brwinia herbicola.

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detection, the genome of P. Luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypepides encoded by the genes are used for detection/identification of P. Luminescens, e.g. in foods. The genes, proteins, Ab and cells to polypepides encoded by the genes are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that compounds the minanscens or sensitivity to toxins and antibiotics produced by P. C. response or sensitivity to toxins and antibiotics produced by P. C. Iuminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens centaining the genes and Ab are also useful to the sensitive to P. luminescens and the proteins are as virulence factors and for identifying targets of human diseases for which P. C. luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 WIAPLITYRASCYDVIFPAPQRTLPHSYFSITSQHFASILHAYLGBRIQTRLLVQBLTPQ 120

The invention describes the preparation of carotenoid pigments e.g. canthaxanthins using a cell transformed by a vector having DNA sequences (a) to (e) or substantially homologous sequences (a) a DNA sequence (crEB) coding GSPP synthase of Flavobacterium sp. R1534; (b) a DNA sequence (crEB) coding prephytoene synthase of Flavobacterium sp. R1534; (c) a DNA sequence (crIT) coding phytoene describings of Flavobacterium sp. R1534; (d) a DNA sequence (crIT) coding lycopene cyclase of Flavobacterium sp. R1534, and (e) a DNA sequence (crIT) coding lycopene cyclase of Flavobacterium sp. R1534, and (e) a DNA sequence (crIT) coding lycopene cyclase of carotene beca-oxygenase of a microbe E-196 (FERM BP-4283). The carotenoid or a carotemoid mixture can also be used in preparation of food products. The method is an improved method of fermentation for carotenoid
                                                                                                                                                                                                    242 ITLIGDNRQFWQQQPQAC--SGLRAGLFHPTTGYSLPLAVALADRLSALDVFTSSSVHQT 299
                                                                                                                                                                                                                                                                                    IAHFAQQRWQQQGFFRMLNRMLFLAGPAESRWRVMQRFYGLPEDLIARFYAGKLTVTDRL 359

RI534. This 42368 Da protein introduces the beta-cinone rings at both sides of lycopene to obtain beta-carotene. Enzymes of the Flavobacterium carotenoid biosynthetic pathway (see also AAW06515-18 and AAW00871) can be expressed, optionally with Alcaligenes beta-carotene beta-4-oxygenase, in host cells for the prodn. of lycopene, astaxanthin, beta-carotene, cechinenone, zeaxanthin, canthaxanthin and adonixanthin. (Updated on 17-OCT-2003 to standardise OS field)

These polypeptides are capable of converting the 4-methylene group of a 3-hydroxy-beta-ionone ring to a 4-keto group in doing so these peptides also add a hydroxyl group to the 3-position carbon-atom of the 4-keto-beta-ionone ring. The

The present sequence represents a protein involved in carotenoid biosynthesis. The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtB, crtB, crtI, crtY, crtZ, crtX or crtW are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucoside are collected. The carotenoid glucosides are used as food additives

"Characterization of a Streptomyces antibioticus gene cluster encoding a glycosyltransferase involved in oleandomycin inactivation."
 Gene 134:139-140(1993)
-1- FUNCTION: SPECIFICALLY INACTIVATES OLEANDOMYCIN VIA 2'-0-GLYCOSYLATION USING UDP-GLUCOSE.
 -!- SIMILARITY: Belongs to the UDP-glycosyltransferase family
 Streptomyces antibioticus.

Bacteria; Actinobacteria; Actinobacteridae; Actinomycetales; Streptomycineae; Streptomycetaceae; Streptomyces.
 Transferase; Glycosyltransferase; Antibiotic resistance.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 25; Page 136-137; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astexanthin, by using microorganism having a nucleic acid molecule encoding enzymes in

N

```
the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii zeaxanthin glucosyl transferase (CrtX) enzyme used

 Novel isolated nucleic acid useful e.g. to engineer host cells with the ability to produce particular carotenoids and polypeptides useful in cell-free systems to make particular carotenoids.
 of
 9
 9
 The invention comprises the amino acid and coding sequence of a number carotemoid (crt)-related proteins. The crt-related DNA and protein sequences of the invention are useful for engineering cells which are able to produce carotemoids. The present amino acid sequence represents crt-related protein of the invention

 The present invention describes Pantoea stewartii carotenoid biosynthetic enzymes (1). More specifically described are the geranylgeranyl byrophosphate synthase (crtB), zeazanthin glucosyl transferase (crtX), lycopene cyclase (crtX), phytoene desaturase (crtZ) phytoene synthase (crtB) and beta-carotene hydroxylase (crtZ) enzymes (see ABP96685 to ABP96690) encoded by ACC44759 to ACC44764. (1) can be used for regulating carotenoid biosynthesis in an organism, by over-expressing (1) in an organism. (1) and the genes encoding (1) are useful for converting phytoene to the carotenoids, for creating recombinant organisms that have the ability to produce various carotenoid compounds, and also for enhancing or manipulating carotenoid compounds. (1) can also be used for producing gene products having enhanced or altered activity

 The present sequence represents a protein involved in carotenoid biosynthesis. The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for the preparation of a carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtE, crtB, crtI, crtY, crtZ, crtX or crtW are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucoside are collected. The carotenoid glucosides are used as food additives. (Updated on 17-OCT-2003 to standardise OS field)

There are a total of six relevant genes in a 7900 bp region that cause E. coli cells to produce GGPP and the carotenoids phytoene through caxoaranthin diglucoside, which is the final prod. identified in the carotenoid pathway contd. in plasmid pARG376 (contg. a ca. 13 kb chromosomal DNA fragment isolated by Perry et al. J. Bacteriol., 168:607 (1986). The genes for gerarylgeranty pyrophosphate (GGPP) synthase, phytoene synthase, phytoene delydrogenase-4H, lycopene cyclase, beta carotene hydroxylase, and zeaxanthin glycosylase are represented in AAG13712, AAG13712, AAG13722, AAG13724 and AAG13726 for produce large amts. of the enzymes and hence large amts. of the carotenoids which they synthesise. (Updated on 25-MAR-2003 to correct PP field.) (Updated on 25-MAR-2003 to correct PR field.) (Updated standardise OS field)

aglycones. The polypeptides can be expressed by standard recombinant methodology. The gene and the encoded polypeptides together with other enzymatically active polypeptides, are useful to perform combinatorial biocatallysis in vitro and in vivo in a host cell. They are useful for performing biotransformations on macrolide compounds including avermentin or other macrolide aglycones. The sequences are also useful in vivo in a bacterial host, in vitro in combination with an actinomycete fermentation, and in vitro in combination with ensymatically active polypeptides that are not from the avermectin biosynthetic pathway to effect the synthesis of a pharmaceutically active compound, e.g. an antibiotic. Sequences Abssi973-981 represent polypeptides in the avermectin biosynthetic pathway, involved in the synthesis and/or addition of oleandrose to avermectin aglycones. The present sequence is the S. avermities on the Avermectin aglycones. The present sequence is the synthesis of the Avermectin aglycones. The present sequence is a companied to the synthesis and/or the synthesis and/or addition of oleandrose to avermectin aglycones. The present sequence is the S. avermities of the Avermectin aglycones. The invention relates to the isolation of genes and their encoded proteins from photorhabdus luminescens. The isolated sequences are proteins from photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the geneme of P. luminescens of and related species; to study polymorphisms; to gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens. An advantable that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that corresponse or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. C. luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, barterially the reason of the genes and fungicides. The carries, proteins, vectors containing the genes and Ab are also useful therapeutically (to treat microbial infection by bacteria or fungities of the respective or an especial protein and contibiotics) and as the proteins are sensitive to P. luminescens is a model (particularly plague and the proteins are as virulence the proteins are as wirelenced actions and for identifying targets of human diseases for which P. C. Luminescens is a model (particularly plague and whooping cough). This secures the particular proteins are relative.

 The present invention relates to the isolation of the Micromonospora echinospora spp. calcichensis calicheamicin biosynthetic gene cluster encoding proteins and enzymes used in the biosynthetic production of calicheamicin, including aryltetrasacharide and adjycome. The gene cluster also includes the gene encoding for the protein that confers calicheamicin, resistance. The calicheamicin biosynthetic gene cluster is a nonchromoprotein enediyne biosynthetic gene cluster. Expression vectors containing genes from the biosynthetic gene cluster are also disclosed. The expression vectors are useful for producing calicheamicin prosynthetic proteins. The calicheamicin self-resistance gene provides an approach for gene therapy, for example, by introduction of enediyne resistance genes into bone marrow cells, thus increasing resistance and allowing tolerance to chemotherapeutic doses of calicheamicin. Abull 964-Abull 100 represent proteins and enzymes encoded by genes in the M. Abul 2010 represent proteins and enzymes encoded by genes in the M. Abul 2010 represent proteins and enzymes encoded by genes in the M.
 Novel nucleic acid molecule from nonchromoprotein enediyne biosynthetic gene cluster from Micromonospora echinospora useful for conferring calicheamicin resistance on a subject.

The invention relates to a novel DNA molecule comprising a DNA sequence that encodes a butenyl-spinosyn biosynthetic enzyme, a butenyl-spinosyn PKS (polyketide synthetease) domain, or a spinosyn PKS module. The butenyl-spinosyn biosynthetic genes are useful for increasing the production of butenyl-spinosyn insecticidal macrolides. The genes are also useful for changing the metabolites or products produced by spinosyn-producing

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA SABREGOTO.). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Amino acid sequence of an UDP-glucose:aglycon-glucosyltransferase AAB84216 standard; 06-AUG-2001 AAB84216; 

entry) (first

Ş

protein; 492

UDP-glucose:aglycon-glucosyltransferase, UDP-GAG, cyanohydrin; terpenoid; glucose; transgenic plant; cyanogenic glucoside biosynthesis; pathogen resistance; herbivore response.

Sorghum bicolor

WO200140491-A2

```
The present sequence represents a UDP-glucose:aglycon-glucosyltransferase (UDP-GAG) polypeptide. The enzyme conjugates a cyanohydrin, terpenoid, phenylderivative or hexanolderivative to glucose. UDP-GAG polymucleotides are useful for producing transgenic plants having modified cyanogenic glucoside biosynthesis. Constitutive, inducible or tissue-specific expression of UDP-GAG is useful for obtaining transgenic cyanogenic plants with altered resistance to pathogens and herbivore responses

The invention describes a method of predicting, diagnosing or prognosing a cardiovascular disease by detection of a polymuclectide in a biological sample comprises hybridising at least one of the polymuclectide to a nucleic acid material of ablogical sample, thus forming a hybridisation complex, and detecting the hybridisation complex. The polymuclectides, polypeptides, antisense molecule, antibody and reagent are useful for preparing compositions for preventing, predicting or diagnosing, or a medicament for treating a cardiovascular disease, e.g. arterioscierosis, ischemenia, angina pectoris, or myocardial infarction. This sequence represents a protein identified in the invention a being differentially expressed in individuals with cardiovascular disease

aerocolonigenes (ATCC 39243). The glycosyl transferase (GT) may be from any organism of the order Actinomycetales. GT is used in a method of glycosylating indolopyrrolocarbazole derivs. Glycosylated indolopyrrolocarbazole derivs. are useful as anti-tumour agents. GTs can be made by recombinant means using new GT-producing strains Streptomyces lividans TX21 (pNGT207) FERM BP-5091 and S. morbaraensis BA 13793 (pNGT207) FERM BP-5090 (Updated on 16-OCT-2003 to standardise OS field)

AAR93982 is a glycosyl transferase enzyme derived from Saccharothrix

Claim 4; Page 4-6; 45pp; Japanese

Gene coding for glycosyl transferase - useful in glycosylation of indolo:pyrrolo carbazole derivs.

polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic construction injury (CCI) and spared nijury (NNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon substrates.

Claim 15; Page 134-135; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in

```
ô
the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of teroids flavours and tragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii geranylgeranyl pyrophosphate synthase (CTLE) enzyme

enzymes (II. More specifically described are the geranyigeranyl pyrophosphate synthase (crtB), zeaxanthin glucosyl transferase (crtX), lycopeme cyclase (crtB), phytoene explase (crtX), phytoene expanses (crtZ), phytoene synthase (crtB) and beta-carctene hydroxylase (crtZ) enzymes (see ABP96685 to ABP96690) encoded by ACC44759 to ACC44764. (I) can be used for regulating carotenoid biosynthesis in an organism, by over-expressing (I) in an organism, such that the carotenoid biosynthesis is altered in the organism. (I) and the genes encoding (I) are useful for converting phytoene to the carotenoids, for creating recombinant organisms that have the ability to produce various carotenoid compounds, and also for enhancing or manipulating carotenoid compounds. (I) can also be used for producing gene products having enhanced or altered activity

This invention describes a novel method for the preparation of carotenoids using genes and proteins isolated from Candida utilis. The invention specifically describes the isolation of a 3-hydroxy-amethylglutaryl coenzyme A (HMG-COA) reductase protein. This sequence represents the Candida utilis crtE protein which is used in the method of the invention. (Updated on 17-OCT-2003 to standardise OS field)

The present sequence represents a protein involved in carotenoid biosynthesis. The specification describes astaxanthin diglucosides and adonixanthin-3'-glucosides. The specification also describes a method for carotenoid glycoside, in which all, or part of, carotenoid biosynthesis genes crtE, crtB, crtI, crtY, crtZ, crtX or crtW are introduced to a microbe or plant and expressed. The transformed organism is cultured and astaxanthin diglucosides, adonixanthin-3'-glucosides, and/or astaxanthin monoglucoside are collected. The carotenoid glucosides are used as food additives. (Updated on 17-OCT-2003 to standardise OS field)

The present sequence is that of a recombinant Erwinia herbicola geranyl-

Geranyl pyrophosphate (GGPP) synthase. The N-terminal 13 residues of the
cative GGPP synthase (AAMOII19) are deleted and replaced by 4 extraneous
amino acids from pARC306, providing a more active enyzme. The most active
to form of the enzyme is generated by deletion of the Ball-EcoRV fragment
to indicated in AAT40790. GGPP is a 20-carbon atom precursor of phytoene
to from GGPP. Production of total carotenoids in a plant can be increased by
transforming the plant with DNA encoding enzymes involved in the
transforming the plant with DNA encoding enzymes involved in the
biosynthesis pathway, in particular the lycopene cyclase gene (AAT40795).
Cycopene is prepared biosynthetically from phytoene through four
sequential dehydrogenation reactions which can be carried out by a single
dehydrogenase (AAMOII23) in Erwinia sp. Beta- carotene is produced by
the action of lycopene cyclase on lycopene. A chloroplast transit peptide
of the tobacco ribulose bis-phosphate carboxylase-oxygenase gene (see
AAT40794) is operatively linked in frame to the 5' end of the lycopene
cyclase structural gene. This leads to increased production of total
carotenoids in the chloroplast of transformed plants as compared to
native, non-transformed plants of the same type. Beta-carotene is an
effective and apparently harmless food colourant and is also in the
cyclase structural synthesis of further C40 carotene is an
effective and apparently harmless food colourant and is also in the
caranthin and zeaxanthin diglucoside. (Updated on 25-MR-2003 to correct
CPP field.) (Updated on 16-OCT-2003 to standardise OS field)
 Increasing prodn. of total carotenoid(s) in a higher plant - by transforming with vector encoding chloroplast transit peptide operably linked to the Erwinia herbicola lycopene cyclase structural gene.

synthase. GGPP synthase is a enzyme which, along with phytoene synthase (see also AAW00143), catalyse the formation of carotenoids, particularly phytoene. The N-terminally truncated form of GGPP synthase has the first thirteen amino acids replaced by four heterologous amino acids derived from the plasmid pARC306A. This enzyme is about twice as active as the higher activity and was cloned into plasmid pARC489D. The GGPP synthase coding sequence may be attached to the transit peptide sequence given the AAW00344, for transport into tobacco chloroplasts. This allows the tobacco plants to produce high levels of phytoene for use in the treatment of skin disorders. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 16-OCT-2003 to standardise OS field)

 Transformed plants containing DNA encoding Erwinia herbicola enzymes - esp. geranyl:geranyl pyrophosphate synthase and phytoene synthase, allows large scale production of phytoene.
 256
 136
 196
 195
 255
 The sequences given in AAW00341-42 represent the wild type and an N-terminally truncated form of geranylgeranyl pyrophosphate (GGPP) synthase. GGPP synthase is a enzyme which, along with phytoene synthase (see also AAW00343), catalyse the formation of carotenoids, particularly phytoene. The N-terminally truncated form of GGPP synthase has the first thirteen amino acids replaced by four heterologous amino acids derived from the plasmid phRCJ96A. This enzyme is about twice as active as the wild type enzyme. A C-terminal truncated protein was found to have even higher activity and was cloned into plasmid pARC489D. The GGPP synthase

 Geranylgeranyl pyrophosphate synthase.
```

Example 2; Fig 2; 102pp; English

A novel DNA molecule has been isolated which encodes an Erwinia herbicola lycopene cyclase enzyme that converts lycopene to beta—carctene. The DNA molecule comprises at 1125 bp and is present in the plasmids parcial, parcised and parcial. The present in the plasmids amino acid sequence corresponding to the nucleotide base sequences of extrain preferred DNA segments of the structural gene for geranylgeranyl pyrophosphate (GGPP) synthase. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yeasts or plants, with increased beta-carcene levels. Beta-carcher is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 25-MAR-2003 to correct PF field.) **8888888888888888**

 biosynthesis in nonphotosynthetic and photosynthetic prokaryotes.", proc. Natl. Acad. Sci. U.S.A. 87:9975-9979(1990).
-!- FUNCTION: This enzyme converts physoene into lycopene via the intermediaries of phytofluene, zeta-carotene and neurosporene by the introduction of four double bonds.
-!- COFACTOR: PAD (Probable).
 Bacteria; Proteobacteria; Gammaproteobacteria; Enterobacteriales;
Enterobacteriaceae; Pantoea.
NCBI_TaxID=549;
 MEDLINE-91088634; PubMed=2263648; Armstrong G.A., Alberti M., Hearst J.E.; Conserved enzymes mediate the early reactions of carotenoid
 PATHWAY: Carotenoid biosynthesis. SIMILARITY: Belongs to the phytoene dehydrogenase family.
